

## MARCH 2021- QUARTERLY ACTIVITIES REPORT

---

### Quarterly Highlights

#### Group Output

- **Gold sales of 63,139 ounces for the quarter** – although at the lower end of expectations Westgold remains on track to deliver its CY2021 guidance of 270,000 – 300,000oz at C1 Cash costs of \$1200-\$1300/oz and AISC of \$1450 - \$1550/oz.

#### Cost Guidance

- **March quarter is third consecutive quarter beating cost guidance** - despite lower output.
  - **Cash cost of sales (C1)** of A\$1,158/oz.
  - **All-in Sustaining Cost (AISC)** of A\$1,399/oz.

#### Group Financials

- **Mine operating cash flow remains strong** - at \$56.2 million for the quarter with net mine cash flow of \$12.0 million.
- **Cash build of 9% over the quarter** - cash and bullion on hand of \$178.0 million at end of quarter.
- **Lower gold price impacted revenue for the quarter** - with \$141 million from gold sales at \$2,232/oz (\$167/oz lower than Q4, CY2020).
- **Capital expenditure for gold operations during the quarter of \$56.2 million** - \$9.0 million was sustaining capex, \$38.4 million on growth, \$5.8 million on plant and equipment and \$3.0 million on exploration.
- **Group hedge position significantly reduced** - by delivering 28.5% of Group quarterly sales output at A\$2,083 into its hedges to reduce total hedged ounces to 150,000oz (or ≈7% of the Group's Ore Reserves).

#### Growth and Exploration

- **Growth and Exploration Strategy activated** - key appointments made during the quarter to focus on accelerating regional exploration and growth opportunities where Westgold can leverage its strong balance sheet and established mining and processing infrastructure.
- **Three new mines in pre-development during H2, 2021** - Bluebird underground mine and Aladdin open pit at MGO and Fender underground mine at CGO.
- **Stunning exploration results** - from the Group's existing operations at Paddy's Flat and Nannine regional development pipeline at MGO.

## QUARTERLY OVERVIEW

Westgold Resources Limited (ASX: WGX) is pleased to report another solid result for the March 2021 quarter. During the period operations were hampered by COVID-19 related workforce availability and mobility, seasonal weather impacts and one-off issues restricting access to planned mining areas.

Despite these issues the Group achieved gold sales of 63,139oz (at the lower end of expectations) and again solidly outperformed our cost guidance. Subject to further unforeseen COVID-19 events the Company remains on track to achieve its CY 2021 guidance of 270,000 – 300,000oz at C1 Cash costs of \$1200-\$1300/oz and AISC of \$1450 - \$1550/oz.

Westgold's balance sheet continues to strengthen despite lower gold prices, with cash growing by 9% over the previous quarter to \$178 million leaving the Company in a very strong fiscal position with no corporate debt. The quarterly performance depicts growing consistency of output and steady outperformance of cost guidance over the past 12 months (refer **Figure 1**).

### Executive Chairman Peter Cook commented:

“The Group's performance has been remarkable in light of the events that impacted the workforce late last year and the challenges our operations faced during this quarter. Consistency in delivering operational outputs is the key focus for Westgold in 2021 and despite lower output, our third consecutive quarterly outperformance to beat our cost guidance is very pleasing and shows that Westgold can be one of the more profitable Australian goldminers.

We expect to continue to improve our physical and financial outputs over the remainder of 2021.

The calamity that is COVID-19 and the impacts and actions that are taken to defend against it have and will continue to constrain the mining sector's skilled workforce. These impacts have been exacerbated by intra-, inter and international travel restrictions as the West Australian mining sectors demand for personnel significantly outstrips its supply capability. Westgold continues to quickly adapt to these fluid circumstances and manage all components of the value chain by taking a more measured approach to project planning and ramp ups.

With a view to growth, Westgold has now reached a tipping point with capital expenditure such that we can now consider new exploration and growth opportunities. Our Murchison landholding is extensive and highly prospective with the Group now in a position to aggressively pursue greenfield exploration and growth targets across the region.”

### COVID-19 Response

Westgold operates a COVID-19 committee of specialists to manage our response to COVID-19 and its impacts on the health and wellbeing of our staff, contractors and stakeholders. The committee enables the Company to strategise, manage and react rapidly to government-imposed rules on intrastate, interstate and international travel restrictions which impact our staff and operations. As a result, the Company has become operationally agile and able to adapt to whatever obstacles arise to ensure business continuity.

The Company maintains a range of measures across its business consistent with advice from State and Federal health authorities to safeguard the health and welfare of our employees and their respective communities. To date there have been no confirmed cases of COVID-19 across the business.

An outcome of the Government's approach to COVID-19 is an intensifying skills shortage across the mining sector. This has had an impact on our outputs during the quarter. This unpredictable and rapidly changing environment presents some significant challenges to the business but has not reached a point where Westgold considers it necessary to revise its published CY2021 guidance.

### Occupational Health, Safety and Environment (OHS)

The Group's safety statistics reveal a solid improvement in key performance metrics with the 12-month moving average lost time injury frequency rate dropping 22% to 2.58 (from 3.3) at the end of the quarter.

Westgold maintains its focus on continuous improvement of its safety management systems and training. During the quarter revised site-specific 'project operational safety plans' (POSP) and OHS strategic plans were rolled out as part of this process.

Key safety statistics measures for each key business unit are summarised in **Table 1** below.

**Table 1: Westgold Group Quarterly Safety Performance**

| Site                        | LTI      | LTIFR       | TRIFR*      |
|-----------------------------|----------|-------------|-------------|
| Cue Gold Operations         | 1        | 3.15        | 59.8        |
| Meekatharra Gold Operations | 1        | 1.59        | 30.3        |
| Fortnum Gold Operations     | 2        | 3.57        | 33.5        |
| Minterra                    | 2        | 2.82        | 42.3        |
| <b>Group Totals</b>         | <b>4</b> | <b>2.58</b> | <b>31.0</b> |

\*TFIFR excludes very minor treatments and ailments

There have been no environmental breaches or significant incidents over the quarter.

## GROUP OPERATIONAL PERFORMANCE SUMMARY

Physical and financial outputs for the Group for this quarter are summarised in **Table 2** below.

**Table 2: Group Operational Summary**

|                                 |               | MGO<br>March Qtr<br>2021 | CGO<br>March Qtr<br>2021 | FGO<br>March Qtr<br>2021 | Group Total<br>March Qtr<br>2021 |

## FORTNUM GOLD OPERATION (FGO)

### Output and Fiscal Overview

FGO gold production for the quarter was 16,926oz (16,525oz sold) at cash cost of sales (C1) of \$861/oz and AISC of \$1,135/oz, generating a mine operating cash inflow of \$18.2 million and a net mine cash inflow of \$13.6 million.

Quarterly performance at FGO over the past 12 months is illustrated in **Figure 2** below:

The rolling 12-month production output aggregates to 62,478oz of gold at a cash cost (C1) of \$1,018/oz and an AISC of \$1,305/oz.

FGO continues to deliver strong profit from the Starlight underground mine and additional mill feed sourced from large, existing low-grade surface stockpiles. This quarter saw expanded production in the Starlight mine including the Moonlight, Twilight North and Trev's lodes.

Westgold is now evaluating new potential open pit opportunities to supplement underground ore sources at Fortnum increasing the ore optionality and mine life across this under-explored tenement package. Targeted long-term production for FGO is unchanged at 65,000 – 75,000oz per annum.

### FGO Exploration

- Starlight Underground**

Systematic extensional exploration continued at the at the Starlight underground mine with positive results including the following intercepts:

- **7.3m at 14.61g/t Au** from 80m in ST1086EX01
- **17.7m at 6.21g/t Au** from 123m in ST1086EX08.

- **Forrest Open Pit Prospect**

As highlighted, early-stage evaluation of open pit targets proximate to Fortnum commenced during the quarter. Westgold's maiden drilling program of the Forrest Prospect (where Westgold owns 100% of the gold rights) has returned results including:

- **13m at 5.32g/t Au from 31m** in 20FSTRC003
- **5m at 8.2g/t Au from 41m** in 20FSTRC008
- **7m at 6.31g/t Au from 58m** in 20FSTRC019

All significant intercepts received for the quarter are tabulated in **Appendix A**.

## **MEEKATHARRA GOLD OPERATION (MGO)**

### **Output and Fiscal Overview**

The Company's MGO demonstrated its robustness during the quarter producing 25,023oz (25,983oz sold). Despite operational constraints unit costs at MGO were a little higher due to the lower output and revised mine plans with cash cost of sales (C1) of \$1,407/oz and AISC of \$1,704/oz.

The higher costs and a \$167/oz lower gold price resulted in a lower than expected mine operating cash flow of \$16.9 million (\$23.3 million in the previous quarter) and net mine cash for the quarter of \$5.1 million from the \$13.5 million in the previous quarter.

The Bluebird processing hub processes both underground and open pit ore and performed strongly treating 405,699 tonnes for the quarter (in-line with the overall 1.6-1.8 million tonne capacity). Metallurgical recovery increased slightly this quarter as ore blends were optimised. Unit costs were marginally higher due to a mobile crushing campaign that reprocessed historic mill "scat" material and two planned shutdowns occurring during the quarter.

- **Underground Operations**

Mine production at MGO's Paddy Flat underground was impacted during the quarter by a short-term ventilation issue which restricted access to some higher-grade areas planned to be mined in the quarter. This resulted in alternative lower grade stopes being extracted and hence a lower overall head grade delivered for the quarter. This has now been rectified.

Underground mining continued at the South Emu and Triton underground mines in the Reedy's area where South Emu advanced through an area of lower grade whilst Triton's North Lodes continued their early development extending the known strike and expanding the overall ore system.

First stoping at Triton is expected to commence in the ensuing quarter once ventilation and escapeway establishment is complete.

A requirement to redeploy underground personnel across existing operating underground mines due to COVID-19 related manning issues also impacted planned production from the recently started Bluebird underground mine. Bluebird operated with a skeleton crew on dayshift only for the majority of the quarter. It is anticipated that the Bluebird underground mine will be fully manned and operational during the third quarter of CY21.

## • Open Pit Operations

Open pit mining continues to supplement underground production at MGO. Mining was primarily from the Maid Marion pit during the quarter, although the remaining stockpiles from 5 Mile Well pit, which finished near year end, also formed part of the plant feed. Various open pit mines will continue to supplement the underground ore sources to ensure consistent levels of production over the ensuing periods.

Quarterly performance over the past 12 months is illustrated in the **Figure 3** below:

The rolling 12-month production output for MGO aggregates 104,833oz at a Cash cost of sales (C1) of \$1,276/oz and AISC of \$1,592/oz.

Targeted long-term production for MGO is 105,000 - 120,000oz per annum.

## MGO Exploration

The dominant producer at MGO, Paddy's Flat, has again produced a series of stunning results, this time from the high-grade, structurally complex Vivian's area of the mine. Best results included:

- **3.24m at 71.95 g/t Au** from 58m in 20VIDD212,
- **1m at 229.30g/t Au** from 18m and **1.23m at 166.27g/t Au** from 25m in 20VIDD231 and
- **3.23m at 43.77g/t Au** from 37m in 20VIDD233a.

These grades point to the significant endowment of this extensively mineralised system.

## • Aladdin Open Pit

Development has continued apace to support the imminent return of open pit mining to the Nannine region. With site works underway at Aladdin, the final stages of resource definition work at satellite deposits now provide opportunities to extend the initial mining plan in this area and bring these additional targets into the plan.

## March 2021 – Quarterly Activities Report

Best intervals from these additional potential open pit targets include:

- **Caledonian South** - 8m at 6.15g/t Au from 31m in 20NNRC173
- **Nannine Reef** - 6m at 16.82g/t Au from 19m in 20NNRC243
- **Baileys Island North** - 7m at 7.43g/t Au from 46m in 20BIRC014

On the grassroots front, conceptual exploration in the Banjo Bore region, north of Meekatharra has returned a best result of **16m at 4.85g/t Au from 32m** in 21MNRC004 which will have immediate follow-up.

All significant intercepts received for the quarter are tabulated in **Appendix B**.

## CUE GOLD OPERATION (CGO)

### Output and Fiscal Overview

CGO producing 20,543oz (20,631oz sold) during the quarter. Cash cost of sales (C1) for the quarter were \$1,098/oz and AISC were reduced to \$1,247/oz. The operation generated a mine operating cash flow of \$21.1 million, also down due to the lower gold price achieved.

CGO generated a net mine cash outflow of \$6.6 million after \$26.1 million was invested in growth capital, predominantly at Big Bell, but also with some open pit pre-stripping at Cuddingwarra.

Quarterly performance over the past 12 months is illustrated in the **Figure 4** below:

The rolling 12-month production output aggregated 80,981 oz at a Cash cost of sales (C1) of \$1,160/oz and an AISC of \$1,360/oz.

Targeted long-term production for the CGO is 100,000 - 110,000oz per annum which will be predominantly produced by Big Bell.

- **Underground Operations**

Underground mining during the quarter was dominated by Big Bell producing 136,743 tonnes at 2.40 g/t Au which includes a significant tonnage of lower grade (but economically viable) remnant cave material necessarily bugged to assist the new cave development.

The smaller Comet underground mine continues to contribute to overall CGO production by incrementally extending its mine life and serving as supplementary feed to the Tuckabianna process plant until Big Bell ramps up to full planned capacity.

Big Bell had a slow start to the quarter with reduced labour availability due to seasonal absenteeism, COVID-19 related travel restrictions impacting workforce availability and mobility and the emotional impact of the fatality in the previous quarter.

Despite these obstacles, Big Bell achieved two significant milestones during the quarter with the first cave stoping commencing in the southern section of the mine and the establishment of a new cave horizon under the historic cave front.

This process has required a conservative approach to the sequencing of development due to manning issues and challenges presented by post blasting exclusion zones., This has delayed the ramp-up process during the quarter and consequently the establishment of multiple mining fronts has taken longer than expected.

By the end of the quarter the first slot was fired into virgin ground within the new cave front under the historic cave. This new cave horizon will enable the conventional extraction of 'new' cave ore from the resource during Q2, CY21 as opposed to the remnant and lower grade, historic cave ore.

A newly established balanced chevron cave front with an increased number of ore drawpoints will provide greater operational flexibility and enable higher cave output going forward. As such the Big Bell mine enters a new stage of its evolution and is now expected to reach planned steady-state production in the second half of this calendar year.

**Figure 4: Westgold's Big Bell Underground @ CGO (from pit crest – March 2021)**

- **New Underground Mine in 2021 - Fender**

Mining studies were carried out in relation to a transition to underground mining at the recently completed Fender open pit on the southern limits of the Big Bell shear. It is expected that the proposed underground mining at Fender may commence before the end of CY21.

- **Open Pit Operations**

As a part of the strategy to extend our operational flexibility, Westgold established a new open pit mining hub at Cuddingwarra North. Pre-strips commenced at the Jim's Find (refer **Figure 5**) and the City of Chester open pits which will provide supplemental ore to the CGO plant over the ensuing year.

With a view to optimising Group assets, Westgold purchased a fleet of larger, rigid body mining trucks to mine the Cuddingwarra area. The first Cat 777 trucks are now in service at Cuddingwarra with the full cost benefits of this bigger fleet not expected to be fully evident until late in Q3, CY21.

**Figure 5: Pre-strip at Jim's Find Open Pit @ CGO**

### CGO Exploration

Infill drilling ahead of mining at Big Bell continues to deliver large intervals of economic grades. Best intercepts for the quarter were:

- **30m at 6.17g/t Au** from 133m in 20BBDD0052,
- **35.18m at 4.88g/t Au** from 131m in 20BBDD0054
- **45.15m at 3.48g/t Au** from 109m in 20BBDD0058

Westgold open pit mining is now well established in the Cuddingwarra North area. The initial mine in the district, Jim's Find, is progressing well and in line with geological expectations. As such, attention over the last quarter has been on readying 2022 production sources for detailed mine planning.

As part of this work, a series of resource drilling programs have been undertaken with better results being:

- **Coventry Area**
  - **7m at 11.77g/t Au from 16m** in 20CVRC040
  - **12m at 9.28g/t Au from 33m** in 20CVRC097
- **City of Sydney Area**
  - **7m at 14.75g/t Au from 40m** in 20SYRC041
  - **10m at 14.8g/t Au from 3m** in 20SYRC066

On the grass roots exploration front conceptual work has returned some excellent initial results including:

- **Dubbo Prospect**
  - **13m at 5.2g/t Au from 15m** in 21DBRC058
- **Jim's Find South Prospect**
  - **10m at 5.65g/t Au from 32m** in 20JFWD041

All significant intercepts received for the quarter are tabulated in **Appendix C**.

### EXPLORATION AND GROWTH

As Westgold transitions from its development phase the Board has turned its focus to expanding the business through exploration and growth. The Company currently has substantial mining and exploration tenure and continues to consolidate its strategic holdings across the Central Murchison region.

With a strong balance sheet due to accumulating free cashflow, the Company's focus can now shift from capital expenditure to greenfield exploration. As such during the quarter, the Company established a new Exploration and Growth business unit and made key appointments to lead this unit. The focus of this business unit is to explore, develop and/or acquire additional resources within the region that allows Westgold to leverage its extensive infrastructure and maximise the return on Group investment.

The Board of Westgold is committed to an aggressive exploration and growth strategy and now has the balance sheet to support it. As such Westgold is currently developing a strategic plan to invest \$80-\$100m on greenfield exploration over the next 3-4 years.

#### ▪ Alto Metals Limited

During the quarter, Westgold acquired an  $\approx 8\%$  stake in junior explorer Alto Minerals Limited (ASX: AME) via a share purchase from Middle Island Resources. AME is a Sandstone focused exploration company without processing infrastructure that is advancing gold resources that are potentially within trucking distance of Westgold's Cue or Meekatharra plants.

### CORPORATE

#### Share Capital

Westgold's capital structure at the end of the quarter is summarised in **Table 3** below.

**Table 3: Westgold Capital Structure at 31 March 2021**

| Security Type                 | Issued      |
|-------------------------------|-------------|
| Fully Paid Ordinary Shares    | 423,855,270 |
| Performance Zepo's (unvested) | 1,073,033   |
| Performance Rights (unvested) | 1,356,295   |

#### Divestments

During the quarter Westgold completed the final divestment of its non-core assets with the completion of the sale of its non-core lithium royalties and exploration rights to Reed Industrial Minerals for \$17.5 million.

#### Cash, Bullion and Liquid Assets

Westgold's cash and bullion grew to **\$178** million over the quarter. **Figure 6** details key cash movements during the quarter:

## Debt

Westgold currently has no corporate debt. The Company has lease commitments on some acquired plant and equipment under normal commercial terms with expected repayments of ≈\$16 million in the current year.

## Hedging

Westgold continued to deliver into its hedges at a disproportionate rate (28.5%) of its output during the quarter and as such has reduced its overall hedge position to 150,000oz at an average A\$2,083 per ounce. Westgold only has 7% of its ore reserves hedged and the counterparty to all of Westgold's hedging is Citibank.

**This announcement is authorised for release to the ASX by Peter Cook, Executive Chair.**

**Ends.**

### Compliance and Forward-Looking Statements

#### Exploration Targets, Exploration Results and Mineral Resources

The information in this report that relates to Exploration Targets, Exploration Results and Mineral Resources is compiled by Westgold technical employees and contractors under the supervision of Mr. Jake Russell B.Sc. (Hons), who is a member of the Australian Institute of Geoscientists. Mr Russell is a full time employee to the company, and has sufficient experience which is relevant to the styles of mineralisation and types of deposit under consideration and to the activities which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Russell consents to the inclusion in this report of the matters based on his information in the form and context in which it appears. Mr Russell is eligible to participate in short and long term incentive plans of the company.

#### Ore Reserves

The information in this report that relates to Ore Reserves is based on information compiled by Mr. Anthony Buckingham B.Eng. (Mining Engineering) MAusIMM. Mr. Buckingham has sufficient experience which is relevant to the styles of mineralisation and types of deposit under consideration and to the activities which they are undertaking to qualify as a Competent Person as defined in the 2012 Editions of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC 2012)”. Mr. Buckingham consents to the inclusion in this report of the matters based on his information in the form and context in which it appears. Mr. Buckingham is a full-time senior executive of the Company and is eligible to and may participate in short-term and long-term incentive plans of the Company as disclosed in its annual reports and disclosure documents.

#### Exploration Results

The information is extracted from the report entitled ‘Exploration Highlights - 30 September 2019 Quarter’ created by Westgold on 14 October 2019 and available to view on Westgold’s website ([www.westgold.com.au](http://www.westgold.com.au)) and the ASX ([www.asx.com.au](http://www.asx.com.au)). The company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement.

The company confirms that the form and context in which the Competent Person’s findings are presented have not been materially modified from the original market announcement.

#### Forward Looking Statements

Certain statements in this report relate to the future, including forward looking statements relating to Westgold’s financial position and strategy. These forward-looking statements involve known and unknown risks, uncertainties, assumptions and other important factors that could cause the actual results, performance or achievements of Westgold to be materially different from future results, performance or achievements expressed or implied by such statements. Actual events or results may differ materially from the events or results expressed or implied in any forward-looking statement and deviations are both normal and to be expected. Other than required by law, neither Westgold, their officers nor any other person gives any representation, assurance or guarantee that the occurrence of the events expressed or implied in any forward-looking statements will actually occur.

You are cautioned not to place undue reliance on those statements.

## Appendix A – FGO Significant Intercept Tables

All widths are downhole. Coordinates are for hole collars. Grid is MGA 1994 Zone 50. Significant intervals are >5g/m for areas of known resources and >2g/m for exploration.

## Appendix B – MGO Significant Intercepts Table

All widths are downhole. Coordinates are for hole collars. Grid is MGA 1994 Zone 50. Significant intervals are >5g/m for areas of known resources and >2g/m for exploration.

## Appendix C – CGO Significant Intercepts Table

### Cue Gold Operations

All widths are downhole. Coordinates are for hole collars. Grid is MGA 1994 Zone 50. Significant intervals are >5g/m for areas of known resources and >2g/m for exploration.

| Mine/Lode            | Hole       | North     | East    | RL   | Intercept (Downhole) | From (m) | Dip     |
|----------------------|------------|-----------|---------|------|----------------------|----------|---------|
| <b>Big Bell Mine</b> |            |           |         |      |                      |          |         |

## SECTION 1 SAMPLING TECHNIQUES AND DATA

(Criteria in this section apply to all succeeding sections.)

| Criteria                                                                                                | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Sampling techniques</b></p> <p><b>Drilling techniques</b></p> <p><b>Drill sample recovery</b></p> | <ul style="list-style-type: none"> <li>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where ‘industry standard’ work has been done this would be relatively simple (e.g. ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</li> <li>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</li> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul> | <ul style="list-style-type: none"> <li><b>Diamond Drilling</b><br/>A significant portion of the data used in resource calculations has been gathered from diamond core. Multiple sizes have been used historically. This core is geologically logged and subsequently halved for sampling. Grade control holes may be whole-cored to streamline the core handling process if required.</li> <li><b>Face Sampling</b><br/>At each of the major past and current underground producers, each development face / round is horizontally chip sampled. The sampling intervals are dominated by geological constraints (e.g. rock type, veining and alteration / sulphidation etc.). The majority of exposures within the orebody are sampled.</li> <li><b>Sludge Drilling</b><br/>Sludge drilling is performed with an underground production drill rig. It is an open hole drilling method using water as the flushing medium, with a 64mm (nominal) hole diameter. Sample intervals are ostensibly the length of the drill steel. Holes are drilled at sufficient angles to allow flushing of the hole with water following each interval to prevent contamination. Sludge drilling is not used to inform resource models.</li> <li><b>RC Drilling</b><br/>Drill cuttings are extracted from the RC return via cyclone. The underflow from each interval is transferred via bucket to a four tiered riffle splitter, delivering approximately three kilograms of the recovered material into calico bags for analysis. The residual material is retained on the ground near the hole. Composite samples are obtained from the residue material for initial analysis, with the split samples remaining with the individual residual piles until required for re-split analysis or eventual disposal.</li> <li><b>RAB / Aircore Drilling</b><br/>Combined scoops from bucket dumps from cyclone for composite. Split samples taken from individual bucket dumps via scoop. RAB holes are not included in the resource estimate.</li> <li><b>Blast Hole Drilling</b><br/>Cuttings sampled via splitter tray per individual drill rod. Blast holes not included in the resource estimate.<br/><br/>All geology input is logged and validated by the relevant area geologists, incorporated into this is assessment of sample recovery. No defined relationship exists between sample recovery and grade. Nor has sample bias due to preferential loss or gain of fine or coarse material been noted.</li> </ul> |

| Geology                           | <ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul> | <p><b>MGO</b></p> <ul style="list-style-type: none"> <li>MGO is located in the Achaean Murchison Province, a granite-greenstone terrane in the northwest of the Yilgarn Craton. Greenstone belts trending north-northeast are separated by granite-gneiss domes, with smaller granite plutons also present within or on the margins of the belts.</li> <li>The Paddy's Flat area is located on the western limb of a regional fold, the Polelle Syncline, within a sequence of mafic to ultramafic volcanics with minor interflow sediments and banded iron-formation. The sequence has also been intruded by felsic porphyry dykes prior to mineralisation. Mineralisation is located along four sub-parallel trends at Paddy's Flat which can be summarized as containing three dominant mineralisation styles: <ul style="list-style-type: none"> <li>Sulphide replacement BIF hosted gold. Quartz vein hosted shear-related gold.</li> <li>Quartz-carbonate-sulphide stockwork vein and alteration related gold.</li> </ul> </li> <li>The Yaloginda area is a gold-bearing Archaean greenstone belt situated ~15km south of Meekatharra. The deposits in the area are hosted in a strained and metamorphosed volcanic sequence that consists primarily of ultramafic and high-magnesium basalt with minor komatiite, peridotite, gabbro, tholeiitic basalt and interflow sediments. The sequence was intruded by a variety of felsic porphyry and intermediate sills and dykes.</li> <li>The Reedy's mining district is located approximately 15 km to the south-east to Meekatharra and to the south of Lake Annean. The Reedy gold deposits occur within a north-south trending greenstone belt, two to five kilometres wide, composed of volcano-sedimentary sequences and separated multiphase syn- and post-tectonic granitoid complexes. Structurally controlled the gold occur.</li> </ul> <p><b>CGO</b></p> <ul style="list-style-type: none"> <li>CGO is located in the Achaean Murchison Province, a granite-greenstone terrane in the northwest of the Yilgarn Craton. Greenstone belts trending north-northeast are separated by granite-gneiss domes, with smaller granite plutons also present within or on the margins of the belts.</li> <li>Mineralisation at Big Bell is hosted in the shear zone (Mine Sequence) and is associated with the post-peak metamorphic retrograde assemblages. Stibnite, native antimony and trace arsenopyrite are disseminated through the K-feldspar-rich lode schist. These are intergrown with pyrite and pyrrhotite and chalcopyrite. Mineralisation outside the typical Big Bell host rocks (KPSH), for example 1,600N and Shocker, also display a very strong W-As-Sb geochemical halo.</li> <li>Numerous gold deposits occur within the Cuddingwarra Project area, the majority of which are hosted within the central mafic-ultramafic ± felsic porphyry sequence. Within this broad framework, mineralisation is shown to be spatially controlled by competency contrasts across, and flexures along, layer-parallel D2 shear zones, and is maximised when transected by corridors of northeast striking D3 faults and fractures.</li> <li>The Great Fingall Dolerite hosts the majority gold mineralisation within the portion of the greenstone belt proximal to Cue (The Day Dawn Project Area). Unit AGF3 is the most brittle of all the five units and this characteristic is responsible for its role as the most favourable lithological host to gold mineralisation in the Greenstone Belt.</li> </ul> |

|          |                       | <ul style="list-style-type: none"> <li>• All modelling and estimation work undertaken by Westgold is carried out in three dimensions via Surpac Vision.</li> <li>• After validating the drillhole data to be used in the estimation, interpretation of the orebody is undertaken in sectional and / or plan view to create the outline strings which form the basis of the three dimensional orebody wireframe. Wireframing is then carried out using a combination of automated stitching algorithms and manual triangulation to create an accurate three dimensional representation of the sub-surface mineralised body.</li> <li>• Drillhole intersections within the mineralised body are defined, these intersections are then used to flag the appropriate sections of the drillhole database tables for compositing purposes. Drillholes are subsequently composited to allow for grade estimation. In all aspects of resource estimation the factual and interpreted geology was used to guide the development of the interpretation.</li> <li>• Once the sample data has been composited, a statistical analysis is undertaken to assist with determining estimation search parameters, top-cuts etc. Variographic analysis of individual domains is undertaken to assist with determining appropriate search parameters. Which are then incorporated with observed geological and geometrical features to determine the most appropriate search parameters.</li> <li>• An empty block model is then created for the area of interest. This model contains attributes set at background values for the various elements of interest as well as density, and various estimation parameters that are subsequently used to assist in resource categorisation. The block sizes used in the model will vary depending on orebody geometry, minimum mining units, estimation parameters and levels of informing data available.</li> <li>• Grade estimation is then undertaken, with ordinary kriging estimation method is considered as standard, although in some circumstances where sample populations are small, or domains are unable to be accurately defined, inverse distance weighting estimation techniques will be used. Both by-product and deleterious elements are estimated at the time of primary grade estimation if required. It is assumed that by-products correlate well with gold. There are no assumptions made about the recovery of by-products.</li> <li>• The resource is then depleted for mining voids and subsequently classified in line with JORC guidelines utilising a combination of various estimation derived parameters and geological / mining knowledge.</li> <li>• This approach has proven to be applicable to Westgold's gold assets.</li> <li>• Estimation results are routinely validated against primary input data, previous estimates and mining output.</li> <li>• Good reconciliation between mine claimed figures and milled figures was routinely achieved during past production history.</li> </ul> |

| <b>Cut-off parameters</b> | <ul style="list-style-type: none"> <li>The basis of the cut-off grade(s) or quality parameters applied.</li> </ul> | <ul style="list-style-type: none"> <li>Underground Mines - Cut off grades are used to determine the economic viability of the convertible Resource. COG for underground mines incorporate OPEX development and production costs, grade control, haulage, milling, administration, along with state and private royalty conditions, Where an individual mine has different mining methods and or various orebody style, COG calculations are determined for each division. These cuts are applied to production shapes (stopes) as well as high grade development. Additionally an incremental COG is applied to low grade development, whereby access to a high grade area is required.</li> <li>On the basis of above process, COG's for the underground mines range from 1.8g/t (sub level caving), 2.4g/t for bulk style open stopes, 2.8g/t for narrow vein style / discrete mechanised production fronts and 5.2g/t for man entry stoping.</li> <li>Open Pit Mines - The pit rim cut-off grade (COG) was determined as part of the Ore Reserve estimation. The pit rim COG accounts for grade control, haulage, milling, administration, along with state and private royalty conditions. This cost profile is equated against the value of the mining block in terms of recovered metal and the expected selling price. The COG is then used to determine whether or not a mining block should be delivered to the treatment plant for processing, stockpiled as low- grade or taken to the waste dump.</li> <li>On the basis of above process, COG's for the open pit mines range from 0.8g/t (whereby the Mill is local to Resources and Mill recoveries are greater than 90%) to 1.4g/t (regional pits with low Mill recoveries).</li> <li>Stockpile COG – A marginal grade was determined for each stockpile inventory to ensure it was economically viable. The COG accounts for haulage, milling, administration, along with state and private royalty conditions. Each pile honoured its Mill recovery percentage.</li> </ul> |

| Criteria                             | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Mining factors or assumptions</b> | <ul style="list-style-type: none"> <li>The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).</li> <li>The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.</li> <li>The assumptions made regarding geotechnical parameters (e.g. pit slopes, stope sizes, etc.), grade control and pre-production drilling.</li> <li>The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).</li> <li>The mining dilution factors used.</li> <li>The mining recovery factors used.</li> <li>Any minimum mining widths used.</li> <li>The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.</li> <li>The infrastructure requirements of the selected mining methods.</li> </ul> | <ul style="list-style-type: none"> <li>All Ore Reserve inventories are based upon detailed 3 dimensional designs to ensure practical mining conditions are met. Additionally all Ore Reserve inventories are above the mine specific COG(s) as well as containing only Measured and Indicated material. Depending upon the mining method – modifying factors are used to address hydrological, geotechnical, minimum width and blasting conditions.</li> </ul> <p><b>Open Pit Methodology</b></p> <ul style="list-style-type: none"> <li>Following consideration of the various modifying factors the following rules were applied to the reserve estimation process for the conversion of measured and indicated resource to reserve for suitable evaluation.</li> <li>The mining shape in the reserve estimation is generated by a wireframe (geology interpretation of the ore zone) which overlays the block model. Where the wire frame cuts the primary block, sub blocks fill out the remaining space to the wire frame boundary (effectively the mining shape). It is reasonable to assume that the mining method can selectively mine to the wire frame boundary with the additional dilution provision stated below.</li> <li>Ore Reserves are based on Pit shape designs – with appropriate modifications to the original Whittle Shell outlines to ensure compliance with practical mining parameters.</li> <li>Geotechnical parameters aligned to the Open Pit Ore Reserves are either based on observed existing pit shape specifics or domain specific expectations / assumptions. Various geotechnical reports and retrospective reconciliations were considered in the design parameters. A majority of the open pits have a final design wall angle of 39-46 degrees, which is seen as conservative.</li> <li>Dilution of the ore through the mining process has been accounted for within the Ore Reserve quoted inventory. Various dilution ratios are used to represent the style of mineralization. Where continuous, consistent ore boundaries and grade represent the mineralised system the following factors are applied: oxide 15%, transitional 17% and fresh 19%. In circumstances where the orebody is less homogenous above the COG then the following dilution factors are applied in order to model correctly the inherent variability of extracting discrete sections of the pit floor: oxide 17%, transitional 19% and fresh 21%. To ensure clarity, the following percentages are additional ore mined in relation to excavating the wire frame boundary as identified in point 1 above, albeit at a grade of 0.0 g/t. The amount of dilution is considered appropriate based on orebody geometry, historical mining performance and the size of mining equipment to be used to extract ore.</li> <li>Expected mining recovery of the ore has been set at 93%.</li> <li>Minimum mining widths have been accounted for in the designs, with the utilisation of 40t or 90t trucking parameters depending upon the size of the pit excavation.</li> <li>No specific ground support requirements are needed outside of suitable pit slope design criteria based on specific geotechnical domains.</li> <li>Mining sequence is included in the mine scheduling process for determining the economic evaluation and takes into account available operating time and mining equipment size and performance.</li> <li>No Inferred material is included within the open pit statement, though in various pit shapes inferred material is present. In these situations this inferred material is classified as waste.</li> </ul> |

|----------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                       | <p><b>Underground Methodology</b></p> <ul style="list-style-type: none"> <li>• All Underground Reserves are based on 3D design strings and polygon derived stope shapes following the Measured and Indicated Resource (in areas above the COG). A complete mine schedule is then derived from this design to create a LOM plan and financial analysis.</li> <li>• Mining methodology is based on previous mining experience. All mining systems within the Reserve statement are standardized, mechanized Western Australian methods.</li> <li>• In large disseminated orebodies sub level caving, sub level open stoping or single level bench stoping production methodologies are used.</li> <li>• In narrow vein laminated quartz hosted domains a conservative narrow bench style mining method is used.</li> <li>• In narrow flat dipping deposits a Flat Long Hole process is adopted (with fillets in the footwall for rill angle) and or jumbo stoping.</li> <li>• Stope shape parameters have been based on historical data (where possible) or expected stable hydraulic radius dimensions.</li> <li>• Stope inventories have been determined by cutting the geological wireframe at above the area specific COG and applying mining dilution and ore loss factors. The ore loss ratio accounts for pillar locations between the stopes (not operational ore loss) whilst dilution allows for conversion of the geological wireframe into a minable shape (Planned dilution) as well as hangingwall relaxation and blasting overbreak (unplanned dilution).</li> <li>• Depending upon the style of mineralisation, sub level interval, blasthole diameters used and if secondary support is installed, total dilution ranges from 15 to 35%.</li> <li>• Minimum mining widths have been applied in the various mining methods. The only production style relevant to this constraint is 'narrow stoping' – where the minimum width is set at 1.5m in a 17.0m sub level interval.</li> <li>• Mining operational recovery for the underground mines is set at 100% due to the use of remote loading units as well as paste filling activities. Mining recovery is not inclusive of pillar loss – insitu mineralised material between adjacent stope panels.</li> <li>• Stope shape dimensions vary between the various methods. Default hydraulic radii are applied to each method, and are derived either from historical production or geotechnical reports / recommendations. Where no data or exposure is available conservative HR values are used based on the contact domain type.</li> <li>• Mining sequence is included in the mine scheduling process for determining the economic evaluation and takes into account available operating time and mining equipment size and performance.</li> </ul> |

Measured Resources have a high level of confidence and are generally defined in three dimensions with accurately defined or normally mineralised developed exposure. Indicated resources have a slightly lower level of confidence but contain substantial drilling and are in most instances capitally developed or well defined from a mining perspective. Inferred resources always contain significant geological evidence of existence and are drilled, but not to the same density. There is no classification of any resource that isn't drilled or defined by substantial physical sampling works.</li> <li>Some Measured Resources have been classified as Proven and some are defined as Probable Reserves based on internal judgement of the mining, geotechnical, processing and or cost profile estimates.</li> <li>No Indicated Resource material has been converted into Proven Reserve.</li> <li>The resultant Reserve classification appropriately reflects the view of the Competent Person.</li> </ul> |

| Criteria                                           | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Audits or reviews</b>                           | <ul style="list-style-type: none"> <li>The results of any audits or reviews of Ore Reserve estimates.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <ul style="list-style-type: none"> <li>Reserves inventories and the use of appropriate modifying factors are reviewed internally on an annual basis.</li> <li>Additionally, mine design and cost profiles are regularly reviewed by WGX operational quarterly reviews.</li> <li>Financial auditing processes, Dataroom reviews for asset sales / purchases and stockbroker analysis regularly 'truth test' the assumptions made on Reserve designs and assumptions.</li> </ul>                                                                                                                                                                                                                                                                                              |
| <b>Discussion of relative accuracy/ confidence</b> | <ul style="list-style-type: none"> <li>Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.</li> <li>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</li> <li>Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.</li> <li>It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</li> </ul> | <ul style="list-style-type: none"> <li>Whilst it should be acknowledged that all Ore Reserves are based primarily upon an estimate of contained insitu gold (Resource), it is the competent person's view that the consolidated Reserve inventory is highly achievable in entirety.</li> <li>Given the entire Ore Reserves inventory is within existing operations, with Budgetary style cost models and current contractual mining / processing consumable rates, coupled with an extensive historical knowledge / dataset of the Resources, it is the competent person's view that the significant mining modifying factors (COG's, geotechnical parameters and dilution ratio's) applied are achievable and or within the limits of 10% sensitivity analysis.</li> </ul> |
